"The Evolution of Man."

By ERNST HAECKEL

(*Professor at Jena University*).

THE time has come for a complete, comprehensive, and constructive presentment, in a popular form, of the now irresistible evidence for the evolution of man. This Professor Haeckel accomplishes in the new edition, recently issued in Germany, of his *Anthropogenie*. It is virtually a new work, and it entailed the better part of a year's arduous labour from its author. The text has been considerably augmented, the number of full-page coloured plates has grown to thirty, the number of engravings (many full-page size) to 512, and the number of genetic tables to sixty. These illustrations have all been designed and painted afresh by the author on a larger and finer scale, and are splendid examples of the artistic skill which Professor Haeckel counts among his many attainments. It is now, both in the scientific text and the illustrations, a superb manual of human development.

No reproduction, however augmented, of the older translation could give an idea of the beauty and value of the completed edition of Professor Haeckel's world-famed book. The new translation makes two volumes covering 948 pages, and, with one exception, all the plates and engravings have been retained. The work of editing and translating has been undertaken by Mr. Joseph McCabe, the translator of the *Riddle of the Universe*. The text is rendered in plain language, as far as possible, and all technicalities are made clear to the inexpert reader—a task which has not been difficult in view of the 600 illustrations and tables. The work has, in fact, been written for the general reader, though even for the student it has no rival as a comprehensive statement of the evolutionary position. The first volume deals with the history of the subject, and presents a compendium of modern embryology. It is here that the wealth of illustration is greatest. The second volume discusses the evolution of the race in the light of comparative anatomy and palaeontology, and has also a series of interesting chapters on the evolution of particular organs—organs of sense, reproduction, nerves, etc. The argument and attitude are scientific throughout, and the author never quits the biological territory on which he speaks with almost unrivalled authority to-day. There is a full Index, and also an adequate Glossary.

The work has been printed from new type on the best paper, and is strongly and handsomely bound.

From the Review in "Daily Chronicle":

"These two volumes, which constitute the English translation of the last edition of Professor Haeckel's 'Anthropogenie,' undoubtedly do credit to all concerned in their production. Their *format* is unexceptional, the text remarkably accurate, the numerous and invaluable illustrations most admirably reproduced. We know no biological treatise more attractive and finished in its 'get-up.'

"Professor Haeckel is an indefatigable worker, an enthusiast, the possessor of a receptive or assimilative mind of the first order; and this book represents him at his best. . . . . In the work under discussion the author . . . . has unquestionably produced the most complete and conclusive treatise that has yet been written on the origin of man. . . . It is, indeed, incredible that any impartial student can read these volumes without arriving at the conviction not only that man is related to and evolved from lower animal forms, but also that there is lacking no iota of evidence that could possibly be expected in demonstration of this fact.

"It is probably safe to say that no other living biologist could have adduced such a mass of evidence, or marshalled it with such skill and completeness. . . . . It is impossible to withhold admiration for his skill and erudition. The present edition, we are told, has entailed a year's work on Professor Haeckel's part, and we can quite believe it.

"An instance of the completeness of his reading is furnished by his citation of the recent researches which show that the blood of man and the blood of the anthropoid apes are indistinguishable by the most delicate specific test for blood, which consists in injecting a few drops of an animal's blood into the veins of an animal of a different species. . . . . Each new year continues to see the publication of treatises which attempt to confute the theory of organic evolution. Many of these indicate much studiousness and energy on the part of their authors. Without proposing in any way to impugn the 'liberty of prophesying,' we may express the hope that this latest product of Professor Haeckel's tireless pen may put a period to the production of these treatises. But if there lives a man who is prepared, after reading these volumes, to question their main thesis, he is to be complimented on his inviolate mind. Neither Fate nor facts can touch him."
